If the SMALL ENTITY is shown as YES, verify your current SMALL ENTITY status:

A. If the status is the same, pay the TOTAL FEE(S) DUE shown above.

DETAILED ACTION

Response to Amendment/Arguments

1. The Applicant's amendment, filed 11 September 2008, has been received and entered into the record, respectfully and carefully considered.
2. As a result of the amendment, claims 1, 12 and 19 are amended. Claims 2, 10-11 and 13-18 are canceled. No new claims have been added. Therefore, claims 1, 3-9, 12 and 19 are pending in this application.
3. Applicant's argument filed 11 September 2008 have been fully considered and they are persuasive (See Reason for Allowance and allowable subject matter below)

Reason for Allowance

4. The following is the Examiner's statement of reasons for allowance:

The prior art does not teach the limitations which have been amended onto independent claims 1, 12 and 19. The closest prior art fails to disclose the first and second cipher translation table are maintained as FIFO buffers of random codes, wherein the controller includes a FIFO buffer having an input port coupled to a code generator and an output port coupled to an encoder and to a decoder, each of the plurality of decoders includes an associated set of sub-decoders having respective input ports arranged to receive input encoded data and respective output ports arranged to output decoded data values; and the controller includes, a first cipher translation table having an first input port coupled to a code generator, a second input port arranged to receive an input data value, and an output port coupled to an encoder, the first cipher

translation table configured with data values and associated random codes generated by the code generator, wherein the first cipher translation table outputs the random code associated with an input data value; and a second cipher translation table configured with data values and associated random codes identical to the first cipher translation table, the second cipher translation table including a first input port arranged to receive an input data value, wherein the second cipher translation table outputs the random code associated with an input data value via a first output port and provides the each random code to a respective one of the sub-decoders; data selection logic having a first plurality of input ports coupled to the sub-decoders, a second plurality of input ports arranged to receive respective random codes from the second cipher translation table, a code input port coupled to the first output port of the second cipher translation table, and an output port arranged to output a selected decoded data value, wherein the selection logic is arranged to select one of the decoded data values responsive to a match of an associated random code used by a sub-decoder in generating the decoded data value and a random code received on the code input port from the second cipher translation table upon input of the decoded data value at the first input port and in combination with all other claim limitations in the claims.

The examiner further notes in paragraphs [0032] – [0033], page 8 of the original disclosure, the Applicant disclose “...the nodes and constituent components maybe implemented with **various combination of hardware and software**. For example, the RNG, controller, and encoder/decoders functions maybe implemented on a circuit board containing an implementation-driven combination of processors, ASICs, or FPGAs, and

a node maybe a workstation or mobile computing device. Interconnect interface 146 provides the **physical interface** between node...and the interconnect...". Therefore, a node/communications arrangement/multi-level security communications arrangement as claimed refers to hardware and software combination and therefore, claims 1, 3-9, 12 and 19 are statutory.

Allowable Subject Matter

5. Claims 1, 3-9, 12 and 19 are allowed.
